Innovations in Practice: The relationship between sleep disturbances, depression, and interpersonal functioning in treatment for adolescent depression

Eleanor L. McGlinchey, Jazmin A. Reyes-Portillo, J. Blake Turner & Laura Mufson
Division of Child and Adolescent Psychiatry, Columbia University Medical Center, New York State Psychiatric Institute, 1051 Riverside Drive Box 78, New York City, NY, USA. E-mail: mcglinc@nyspl.columbia.edu

Background: Sleep disturbance is frequently comorbid with depression and sleep complaints are the most common residual symptoms after treatment among adolescents with depression. The present analyses investigated the effect of sleep disturbance in depressed adolescents treated with interpersonal psychotherapy for adolescents (IPT-A) versus treatment as usual (TAU) in school-based mental health clinics. Method: Sixty-three adolescents participated in a randomized clinical trial of IPT-A versus TAU for adolescent depression. Participants were diagnosed with a DSM-IV depressive disorder and assessed for symptoms of depression, interpersonal functioning, and sleep disturbance. Results: Adolescents in the IPT-A group had significantly higher improvement in sleep disturbance compared to the TAU group (p < 0.05). Conclusion: IPT-A may be an effective treatment for improving sleep disturbance in depressed adolescents.
